EDUCATION

University of Alberta

Bachelor of Science, Honours in Computing Science

Edmonton, AB

Expected Dec. 2027

Coursework: Computational Cryptography; Cryptography for Digital Privacy; Intro to Software Engineering; Operating System Concepts; File & Database Management; Web Applications & Architecture.

Certifications: ISC2 Certified in Cybersecurity; CompTIA Security+ (in progress — exam scheduled Sept. 2026).

Leadership: Club organizer — CHADS (Cybersecurity, Hacking & Digital Security Club); Club organizer — WiCyS UAlberta Chapter (Women in Cybersecurity).

EXPERIENCE

Cybersecurity Intern

Jan. – Aug. 2026

Seaspan ULC

Vancouver, BC

- Triageed and closed **708 critical and high vulnerabilities** identified by internal **Nessus/Tenable** scanning across 200+ servers, validating fixes, reviewing false positives, and reducing the standing backlog to ~30 open items.
- Built a triage workflow for pipeline vulnerabilities surfaced in **Microsoft Defender for Cloud DevOps**, developing the process by interviewing development teams to establish code ownership and severity context.
- Redesigned vulnerability tracking to flag findings past remediation SLA or stalled without owner action, prompting formal risk-acceptance sign-off and escalating overdue items to management — applied across **200+ internal and external servers** scanned via Nessus/Tenable, Styxview, and Microsoft Defender.
- Authored and tuned **35 Cyberhaven DLP policies** protecting GDPR and export-controlled data across contractor onboarding and Controlled Goods workflows, reviewing ~24,000 data events; investigated a suspected exfiltration pattern with HR, traced conflicting sensor classifications to confirm staff were moving data to personal cloud storage, and promoted the policy from monitoring to **blocking mode**.
- Built and validated a **Controlled Goods secure server** for the Victoria site by replicating the Vancouver build with required configuration changes, testing permitted versus blocked functionality inside the enclave, and authoring the end-to-end user guide for researchers requiring access — supporting Seaspan's **CMMC Level 2** certification and CUI handling under the U.S. Coast Guard Arctic Security Cutter program.
- Monitored external attack surface and threat intelligence feeds (dark and surface web), identifying leaked credentials, outdated TLS protocols, and missing HTTP security response headers; escalated confirmed credential exposures to the incident response team and documented remediation recommendations with technical owners.
- Supported **CPCSC** (NIST SP 800-171 rev3) and CMMC compliance programs through control evidence collection, policy documentation, and infrastructure inventories maintained in Apptega.
- Authored quarterly cybersecurity reports and security KPIs (Q1–Q3) distributed by the **CFO to executive leadership**, covering vulnerability trends, organizational risk indicators, and emerging AI security concerns.
- Delivered live and recorded security awareness training to ~**200 payroll and finance employees**; co-presented vendor risk findings where third-party posture fell below standard.

Undergraduate Teaching Assistant

Sept. 2024 – Dec. 2025

University of Alberta

Edmonton, AB

- Led a team of **10+ TAs**, setting weekly goals, running standups, clarifying ownership, and maintaining a shared issues board to keep grading and labs coordinated and on schedule.
- Built a CI grading pipeline (**Bash, GitHub Actions**) that automatically compiles C submissions and runs unit tests, replacing manual per-TA setup and making grading faster and more consistent across the team.

Machine Learning Research Intern

Sept. 2023 – Apr. 2024

Alberta Machine Intelligence Institute (Amii)

Edmonton, AB

- Led a 3-person effort to build a data-preparation pipeline in **Python and pandas** that automated transforming raw 2D level data into token-labeled datasets, replacing a manual process and significantly reducing preparation time.
- Built a CLI and notebook interface so researchers could run the pipeline independently; added caching and batched vectorized operations to cut end-to-end processing time and compute cost per run, and introduced pytest coverage to catch silent data-processing errors.

PROJECTS

Lavender: Federated Social Platform | *Python, Django REST Framework, Docker, SQLite, JavaScript*

2025

- Co-developed a federated platform using an inbox-based model where independent nodes push posts and comments to followers on other servers; implemented a **custom authentication class** handling both local users and remote nodes, using per-node credentials and an **allowlist** controlling which federated servers could push inbound content; added three-tier post visibility and object-level permissions restricting edits to content authors.
- Configured **HTTP security controls** including Content-Security-Policy, X-Frame-Options, CSRF protection, and CORS, with authentication required by default on all endpoints; containerized with Docker behind a Caddy reverse proxy.

Trojan Planner: Event Hosting App | *Java, Android Studio, Firebase, JUnit, Espresso, Mockito*

2024

- Built an Android event app with **role-based access control** for participants, hosts, and admins, each with distinct permissions and views; integrated Firebase Auth, RTDB, and Storage with offline-first caching, refactored to MVVM, and added unit/UI tests with CI linting.

TECHNICAL SKILLS

Security Tools: Nessus/Tenable, Defender for Cloud, Cyberhaven DLP, Apptega, Styxview, EASM

Frameworks & Standards: NIST SP 800-171, CMMC, CPCSC, GDPR, ITAR/EAR, Controlled Goods Program

Tools: Bash, Java, C, JavaScript, SQL, Docker, HTMX, CSS
